Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. This library is the normalized version of NCI_CGAP_BII.1. Library was constructed by Bento Soares and M. Fatina Bonaldo.

Rheumatoid arthritis-predictive factor.
Rheumatoid arthritis; dlagnosis; therapy; fibronectin; streptokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       claim 1; Page 54: 83pp; English.

The peptide corresponds to a common region/epitope shared by streptokinase (SK) and fibronectin that is recognized by anti-SK antibodies taken from rheumatoid arthritis (RA) patients. The peptide is used in the diagnosis of the onset/presence of RA, for monitoring the progress of therapy, or for therapy.

Sequence 6-AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein tyrosine kinase conserved peptide.
RAFTK; related adhesion focal tyrosine kinase; human; protein tyrosine kinase; PTK; cell growth; cell differentiation; cell adhesion; cell migration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosis and treatment of rheumatoid arthritis - using a predictive factor peptide corresp. to a region common to fibronectin and streptokinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            52.9%; Score 9; DB 1; Length 6; 50.0%; Pred. Claim 4: Page 67: 76pp: French.
Claim 4: Page 67: 76pp: French.
The inventors claim hipGRF fragments used for the synthesis of hpGRF.
Using the method somatocrinin can be obtd. on a large scale with
good yield and good purity. The prod. is used in man for the
treatment of dwarfism and retarded growth and for anabolic protein
deficiencies. In animals it is useful for promoting wt. growth for
increased prodn., lactation etc. This index is based on EP-122818,
which is the equivalent of AU8424774.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A phage display system was used to screen 5-residue substrate
linkers for cleavage by subtilisin BNN N62D/G166D double mutant
(W00247). The library was subjected to 9 rounds of selection, and
clones that were increasingly sensitive or resistant to cleavage
were selected. Of 21 clones in the sensitive pool, 3 contained a
monobasic substrate linker sequence (W00248) contg. a hydrophobic
residue at P4; the remaining 18 were dibasic (see also W00249-53).
Of 10 substrates selected from the protease resistant pool (W00254-
63), 7 contained no basic sites, 2 were monobasic and 1 was dibasic.
The NGD/G166D double mutant specifically cleaves protein substrates
sequence 5 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-DEC-1996 (first entry)
Subtilisin N62D/G166D substrate peptide.
Subtilisin BPN'; protease; enzyme engineering; protein engineering;
Bacillus amyloliquefaciens; mutagenesis; substrate specificity;
phage display.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ballin, Wells JA;

Practinogenesis, wound healthing and disorders of the immune, central nervous and reproductive systems

Prample VIII; Column 35; 28pp; English

This sequence represents an activin receptor polypeptide predictive kinase domain motif. The nucleic acid molecules of the invention are useful as probes for the identification of additional members of the useful as probes for the recombinant expression of the receptor proteins, and the coding sequences can be used for the recombinant expression of the receptor proteins or functional fragments of them. They may also be used to study the function and activity of activin receptor polypeptides in cells and to identify agents which will modulate activin receptor expression and activity for use in treating conditions such as carcinogenesis, wound healing, use in treating conditions such as carcinogenesis, wound healing, reproductive system (where they may be used to control fertility in humans, domestic and commercial animals).

This sequence was used in the design of a primer which was used in the production of a human ciliary neuronotrophic factor (hCNFS) analogue a lacking the N-terminal 14 amino acids and Cys17 replaced by Ser. This modification reduces the formation of CNFF dimers thereby maintaining biological activity. This primer contains a BglII site in the 5' end and the seventeenth codon is changed to TCT. The amplified sequence was ligated into plasmid pRSETB and transcribed. Wild-type CNFF enhances the survival and development of some sympathetic neurons, spinal neurons of cranial ganglia, motoneurons of the spinal cord and intipocampal neurons. It has been shown to influence the different. Attion of the progenitor glial cells known as 0-2A which differentiate in oligodendrocytes and astrocytes. Truncated forms of CNFF are useful a pharmaceutical composition, which may also comprise a natural of anguloside or derivative or a semisynthetic analogue. for treating nervous disorders. The truncated proteins maintain, prevent loss of correct near page of the provent and processed to the processed for the cover nearons. The truncated proteins maintain, prevent loss of correct nearous disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                vivo panning method, specifically to identify brain, kidney, angiogenic vasculature or timour tissue homing peptide(s).

This synthetic peptide is an example of a brain-homing peptide (s) pisclosure; page 45; 75pp; English.

This synthetic peptide is an example of a brain-homing peptide that was identified using a claimed method for obtaining molecules that home to a selected organ or tissue. This in vivo panning method typically involves administering a phage display companing method typically involves administering a phage display involves administering a phage display in vivo as the factor of the desired organ or tissue. The isolated peptides which home to the desired organ or tissue. The isolated peptides (see this solate tasget or tumour tissue. The isolated peptides (see this solate target molecules (claimed) or to identify and/or isolate target molecules (claimed). The peptides can be directly methods, which require further examination to see if they maintain specificity in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                      Gaps
identified in an isolated subclone. The 3' sequence of PTK22 was obtained by reverse transcription (using the primer of 084786) and PCR amplification (primers Q84787-88) of RNA of human breast carcinoma cell line MDA MG 468. The partial DNA sequence of PTK22 is given in Q84782.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20-JUL-1998 (first entry)
CLK serine/threonine kinase consensus peptide.
CLK serine/threonine kinase; protein kianse; mCLK1; mCLK2; mCLK3;
SMCLK4; mouse; signal transduction.

Preparation of human growth hormone releasing factor (hGRF) fragment by assembling blocks of a few amino acids each on separate resins, cleaving, coupling, and deprotecting; is adaptable to scale up claim 1; Page 22: 25pp; English.

The invention relates to an improved process for preparing an active fragment of human growth hormone releasing factor (hGRF). The invention relates to an efficient process for preparing the amidated fragment of hGRF containing the first 29 amino acids of the N-terminal portion and comprises assembling blocks of a few amino acids each on separate

The prides, cyclised peptides and peptidomimetics - for use in peptides, cyclised peptides, cyclised pertides are considered action of p21 ras protein

Claim 1; Page 93; 100pp; English.

Claim 1; Page 93; 100pp; English.

Claim 1; Page 93; 100pp; English.

Capable of inhibiting the oncogenic action of p21 ras. They may be used in the treatment of adenocarcinomas of the colon, pancreatic carcinomas, neuroblastomas and other cancers of undefined germ cell carcinomas, neuroblastomas and other cancers of undefined germ cell cargin. The cyclised peptides correspond to domains of the oncogenic ras protein which are most flaxible and important in interacting with target proteins upstream and downstream from ras. The peptidomimetics are obtained by molecular modelling. The present sequence represents sequence 7 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example A; Page 38; 80pp; English.

This octamer was found to be immunoreactive with anti-HCV anti-sera.

In the epitope mapping experiment three different samples of anti-sera were reacted with the peptide octamer, and then incubated with HRP-labelled goat anti-human Ig antisera, to enable detection of binding. This epitope starts from amino acid 2345 of the HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C virus (HCV) epitope Ep36.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Column 12; 47pp; English.

Sequences W81413 to W81415 represent peptides flanking a highly conserved tegion of the Kniase domain of receptor protein tyrosine kinase (PTK).

These are used for designing primers to amplify PTK related sequences.

The invention provides sequences v65308 to v65313, v65315, and v65317 to v65319 that encode proteins having a tyrosine kinase domain and a tissue expression pattern of a receptor PTK subtype selected from tyro-1, tyro-3, tyro-4, tyro-5, tyro-6, tyro-10, tyro-10, tyro-11, and tyro-12, respectively. The polynucleotides are useful for the detection of tyrosine kinase domain sequences and detection of tissue expression patterns of PTK subtypes. The polynucleotides are useful for the detection of tyrosine kinase domain sequences and detection of tissue expression patterns of PTK subtypes. The colvas can also be injected into cocytes, the protein expressed, and expression products screened for using antibodies against tyrosine kinase epitopes. These subtypes sequences can be used for the design of oligonucleotides, for use in amplification are used in the diagnosis of diseases associated with (receptor) PTKs.

Recombinant vectors expressing the subtypes can be used to treat related diseases e.g. tumours, by introduction of the vectors into skin transplants, thus specifically targetting tumours as the proteins are released from the matrix.
                                                                                                                                                                                                                                     ô

82229 Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 1000000

Post-processing: Minimum Match 0% Listing first 45 summaries

SwissProt_38:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Sequence-directed DNA-binding molecules - useful in

pharmaceuticals and as molecular reagents

Disclosure: Fig 294; 587Pp; English.

PT Disclosure: Fig 294; 587Pp; English.

To bind DNA test sequences on be tested by placing the test sequence

adjacent to a defined protein-binding screening sequence. Binding

to bind DNA test sequences can be tested by placing the test sequence

adjacent to a defined protein-binding screening sequence. Binding

con fmols. to these test sequences changes the binding sequence. Binding

adjacent to a defined protein-binding screening sequence. Binding

con fmols. to these test sequences changes the binding sequence. Binding

adjacturbed, generating changes in the concentration of free DNA:protein complexes

is adjacturbed, generating changes in the concentration of free DNA:protein

factors (e.g. TFIID), where the target region is typically selected

from DNA sequences adjacent to the binding site for the encaryotic

transcription factor. Numerous exemplary test sequences are given:

the sequences may also be randomly generated. DNA:protein interaction may

be used for screening purposes, e.g. the Herspes Simplex Viral genes. The test

sequences may also be randomly generated. DNA:protein interaction may

be used for screening purposes, e.g. the Herspes Simplex Viral genes.

The sequences given in Q69881 and Q69883-85 illustrate sample test

oligionucleotides for use in the polymerase chain reaction based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T49563 standard; DNA; 13 BP.

The primer sequences given in T49562-63 were used to generate the general sequences given in T49564-66. The general formulae represent oligonucleotides containing the UL9 recognition sequence of the invention sequence of the invention. The method of the invention comprises altering the binding characteristics of a DNA-binding protein to duplex DNA. The method comprises contacting the duplex DNA with a small molecule which binds sequence-specifically to a target region, where, when the which binds sequence-specifically to a target region, where, when the contapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding protein, pref. TFIID or UL9, to its binding of the DNA-binding of the small molecule may inhibit or enhance the binding of the DNA-binding protein to its binding site (see also 763713-4312).
Duplex DNA; target region; binding characteristic; DNA binding protein; TFIID; transcription factor; binding site; inhibition; enhance; cancer; inherited genetic disorder; primer; amplify; ss. Synthetic. US5578444-A.
                                                                                                                                                                                                                                                                                                                                                         Altering binding characteristics of DNA binding proteins to duplex DNA - by attaching specific small cpd. to target region close to the protein's binding site, useful in treatment of viral disease, cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human ribozyme target sequence from HLA-A exon 3 #20.

PT Ribozyme that cleaves specific MHC allele(s) - used to inhibit graft versus host reactions, to overcome blood incompatibility and to treat auto:immune-disease

Claim 5; Fig II; 76pp; German.

Claim 5; Fig II; 76pp; German.

Claim 5; Fig II; 76pp; German.

V10915-V11123 are target sequences for a novel ribozyme which cleaves specific alleles from the major histocompatability complex (MHC). This cromplementary to all mRNA transcribed from vertebrate genes of a specific complementary to all mRNA transcribed from vertebrate genes of a specific allele, and is able to cleave such mRNA. The mRNA has a target region which in case is essentially conserved in all genes of the family but differs from genes of all other MHC alleles to such a degree that no cleavage of mRNA transcribed from these other alleles occurs. This allows the selective reduction or inhibition of expression of all genes of a family or of a single gene. This ribozyme can be used for permanent or translent suppression of expression of MHC alleles, in vivo or in vitro. Specific applications are to prevent guest vs. host or host vs. guest reactions, to prevent blood incompatibilities (partic. of the ABO, rhesus cand Kell systems) and to treat autoimmune diseases such as juvenile need for immunosuppressants in transplant patients. It provides very specific reduction of particular HLA molecules that cause incompatibility between donor and recipient.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Autisense nucleic acid hybridising with an area of the mRNA and/or latejasse nucleic acid hybridising with an area of the mRNA and/or DNA comprising the genes c-jun, jun-B or c-fos, expression of which plays a causal role in neuronal injury, degeneration, cell death and/or neoplasms, can be used to prevent and treat such conditions. c-jun antisense sequences are described in 083267-321 and 08344-45; jun-B antisense sequences are described in 083367-321 and 083446-51. Preferably the antisense sequences are described in 083364-439 and 083446-61; preferably the antisense sequences are phosphorothicate oligonucleotides since these are not destroyed as fast by endogenous factors as naturally occuring molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of antisense c-jun, c-fos or jun-B nucleic acids - for preventing and treating neuronal injury, degeneration, cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           20-SEP-1995 (first entry)
Lubs antisense oligonucloctide.
c-jun; c-fos; jun-B; neuronal injury; cell death; neoplasm; antisense; phosphorothloate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps: 0

Claim 2; Page 23; 86pp; English.
Antisense nucleic acid hybridising with an area of the mRNA and/or
NA comprising the genes c-jun, jun-B or c-fos, expression of which
plays a causal role in neuronal injury, degeneration, cell death and/or
reoplasms, can be used to prevent and treat such conditions
or neoplasms, can be used to prevent and treat such conditions
or neoplasms, can be used are described in Q83267-321 and Q83440-43;
jun-B antisense sequences are described in Q83322-63 and Q83444-45;
and c-fos antisense sequences are described in Q83364-439 and Q83446-
51. Preferably the antisense sequences are phosphorothicate
oligonucleotides since these are not destroyed as fast by endogenous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      19-JAN-1995.

Probes and primers for detection of hepatitis GB virus - specific for 5' non-translated region and non-structural region 3 claim 2; Page 44: 56pp; English.

T76826-56 are primers and probes for detection of Hepatitis GB virus.
T56826-56 are primers and probes for detection of Hepatitis GB virus. Isolation and sequencing of the HGBV genome using the primers and probes will allow design of additional probes and polypeptides which will be useful in the diagnosis and/or treatment of HGBV, both as a prophylactic and therapeutic agent. In particular, the probes could greatly enhance the ability to more accurately diagnose acute and/or chronic viral hepatitis and could provide a safer blood and organ supply by detecting non-A, non-B and non-C hepatitis in these blood and organ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Preparation of autisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in culture

Glaim 10; Fig 6b; 286pp; English.
V48709-86s represent antisense oilgonucleotides directed against the ErbB-2 gene. Of these, only oligonucleotides V48709-91 resulted in significant redcution in ErbB-2 protein expression, while oligonucleotides V48792-886 had little effect. The oligonucleotides variety the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ErbB-2 gene antisense oligonucleotide ErbB-2-67.
ErbB-2; antisense oligonucleotide; modulate; gene expression; ss.
Synthetic.
                                                                                                                                                                                                                                                                                                             Marshall RL, Muerhoff AS;

The oligonucleotides cemplify the invention of negative growth control by JunB or JunD, while v48615-708 had little effect. The oligonucleotides that content and an active downregulation of negative growth control by JunB or JunD, while v48615-708 had little effect. The oligonucleotides that content and neuton of new pecification describes oligonucleotides where hydrogen bonds to cytosine; do not contain four consecutive cytosines; do not contain two sequences of three consecutive nucleotides ach able to form three H-bonds each to four three H-bonds to three consecutive cytosines; do not contain two sequences of three consecutive nucleotides are used to modulate expression of genes, particularly the grown bonds (3R) is given by 2R/3R = 0.33-0.72. The contain contains of proliferation of primary cells untures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              cases
consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive uncleotides each able to form three H-bonds to three consecutive cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErB-2, junB, junD, 7GF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        15-OCT-1998 (first entry)
junB gene antisense oligonucleotide JunB-16.

T Gene coded to DNA of Agrobacterium rhizogenes

Claim 1; Page 2; JOpp; Japanese.

C method for the detection of the plant transforming principle of Agrobacterium rhizogenes. It detects the life plant principle of Agrobacterium rhizogenes it detects the latter half of the TR-DNA ROLB gene. The method provides highly sensitive, easy and highly selective detection of a specific foreign gene from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18-DEC-1996 (first entry)

Human leukocyte antigen typing of tissue samples - using allele-specific amplification to distinguish allele pairs

Example 1: Column 19: 2409; English.

CC The sequences given in 7409; English.

The sequences given in 7409; English.

CC The sequences given in 14081-20 represent probes which were used to resolve the human leukocyte antigen (HLA) DRB1 alleles, DRB1*08, *12

and *1404. This probe sequence Mybridises to the Phe67 conding region of the method of invention which concerns HLA typing of a sample for an unknown pair of alleles. The pair of alleles comprises one of two known types which have the same overall set of polymorphisms but have a different distribution of polymorphisms between their two alleles. The method comprises selectively amplifying the DNA of just one allele of method comprises selectively amplifying the DNA of just one alleles. The method comprises of a locus malaysing the amplified DNA to determine which comprises. The Known type having that allele, and therefore assigning the unknown pair to the known type having that allele. The method comprises to three test stages. The first stage is to establish the number of alleles present in each sample. Primers corresponding to fatily while amplified and potentially detected by hybridisation with a probe. In the second stage, the group or basic type identified of the group identified in the first stage but different from a primers comprises an opt. labeled sequence common to each cother groups identified in stage one. The second primer may be a maximum of different labeled primers, complementary to two or more cother groups identified in stage one. The second primer of different labeled primers, complementary to two or more sequences within the group, or the amplification may be performed with a sequence within the group, or the amplification may be performed of alleles. The method of the propence of a single group of alleles. The method of the propence of a single group of alleles. The method may be used for tissue matching at adiolabeles an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18-FEB-1997 (first entry)
Human CETP HH ribozyme target sequence #550.
Human CETP HH ribozyme; cholesterol ester transfer protein; mRNA cleavage; hammerhead ribozyme; cholesterol ester transfer; plasma lipoprotein; afherosolerosis; atherectomy; reverse cholesterol transport; high density lipoprotein; therapy; CETP; familial hypercholesterolaemia; dystlipidaemia; hypolaphalipoproteinemia; peripheral vaccular disease; hyperbetalipoproteinaemia; RCT; inhibitor; angioplastic restenosis; low density lipoprotein; diabetes; HDL; human;

Pyror regression to vaccutation to the property of the cleavage site in full length CETP. The ribozyme to the position of the cleavage site in full length CETP. The ribozyme binds to continuous of the cleavage site in full length CETP. The ribozyme binds to mediately upstream. The ribozymes are able to cleave mRNA from the conding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP. Created and sngioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteinsemia, hypopalphalipoproteinaemia, disease, hyperbetalipoproteinaemia, hypopalphalipoproteinaemia, created and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding configurence in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes target specific regions of the CETP gene, they have low non-specific activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    28-FEB-1997 (first entry)
Human CETP HH ribozyme target sequence #525.
Human CETP HH ribozyme target sequence #525.
Hammerhead ribozyme; cholesterol ester transfer protein; mRNA cleavage;
neutral lipid transfer; plasma lipoprotein; atherosclerosis; atherectomy;
reverse cholesterol transport; high density lipoprotein; therapy; CETP;
familial hypercholesterolaemia; dyslipidaemia; hypoalphalipoproteinaemia;
peripheral vascular disease; hyperbetalipoproteinaemia; RCT; inhibitor;
angloplastic restenosis; low density lipoprotein; diabetes; HDL; human;
Bisgaier C, Couture L, McSwiggen J, Pape M, Stinchcomb D; WPI: 96-321852/32.
New ribozymae(s) for cleaving cholesterol ester transfer protein mRNA - useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bisgaler C, Couture L, McSwiggen J, Pape M, Stinchcomb D; WPI; 96-321852/32.
New Tibozyme(s) for cleaving cholesterol ester transfer protein mRNA - useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps: 0

hypercholesterolaemia

Claim 4, Page 29; 72pp; English.

Tud9608-Tud9608 represent target sequences for the human cholesterol ester

transfer protein (CETP) hammerhead (HH) ribozymes (see Tud9808-T50137).

CETP is a 74 kD glycoprotein; The numbering of the targets refers to the cheven plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme binds to immediately upstream. The ribozymes and/or expression of the month of the cleavage site in full length CETP. The ribozyme binds to gene encoding CETP, thereby blocking synthesis and/or expression of the mNNA. By inhibiting CETP, the reverse cholesterol transport (RCT)

c pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically familial hypercholesteroleania, atherosclerosis, peripheral vascular complications of diabetes, transplant, catherectomy and angioplastic restencies (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, the CETP gene, they have low non-specific activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28-FEB-1997 (first entry)
Human CETP HH ribozyme target sequence #526.
Human CETP HH ribozyme target sequence #526.
Hammerhead ribozyme; cholesterol ester transfer protein; mRNA cleavage; neutral lipid transfer; plasma lipoprotein; atherosclerosis; atherectomy; reverse cholesterol transport; high density lipoprotein; therapy; CETP; familial hyperchelsterolaemia; dyslipidaemia; hypoalphalipoproteinemia; peripheral vascular disease; hyperbetallpoproteinaemia; RCT; inhibitor; angioplastic restenosis; low density lipoprotein; diabetes; HDL; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 4; Page 29; 72pp; English.
T49608-T49863 represent target sequences for the human cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see T49881-T50137).
CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA - useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Couture L, McSwiggen J, Pape M, Stinchcomb D;

between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme binds to constition of the cleavage site in full length CETP. The ribozyme binds to constitute the cleaves mkNA from the immediately upstream. The ribozymes are able to cleave mkNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mkNA so inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL in size density of the high density lipoproteins (HDL), prolonging HDL and file, and therefore increasing HDL levels of CETP, specifically familial hypercholesteroleamia, atherosclerosis, peripheral specifically familial hypercholesteroleamia, hypoalphaliopproteinaemia, dyslipidaemia, vascular complications of diabetes, transplant, catherectomy and angioplastic restencies (IDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, the CETP gene, they have low non-specific activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human ICAM hamerred and into the cleavage; inhibition; Bnzymatic nucleic acid; ribozyme; trans cleavage; inhibition; Bnzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel #; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; Translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; Inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; ransplant rejection; rheumatoid arthritis; psoriasis; myocardial ischaemia; Rawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents and methods for producing them for use in inhibiting disease related genes

Claim 2. Page 172; 407pp: English.

The present sequence represents a ribozyme) which cleaves ICAM-1

The present sequence represents a ribozyme) which cleaves ICAM-1

The present sequence represents a ribozyme which cleaves ICAM-1

The present sequence represents a ribozyme by the folding

The present sequence in the form secondary folding

The present sequence identified by computer analysis.

Thosymes cleavage sites were identified by computer analysis.

Thosymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease

The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rehumatorid arthritis, asthma and other inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                   Stinchcomb DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW; Grimm S, Karpelsky A, Kisich K, Matulic-Adamic J; KGWiggen JA, Modak A, Pavco P, Beigelman L, Sullivan SW; Sweedler D, Thompson JD, Tracz D, Usman N, Wincott FE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Couture L, McSwiggen J, Pape M, Stinchcomb D;

PT very thosywests of the cleaving cholesterol ester transfer protein mRNA or useful for preventing or treating initial development, progression or vacular diseases, esp. familial protecholesteroleans and account diseases, esp. familial development, progression or vacular diseases, esp. familial development, progression of vacular diseases, esp. familial progression of vacular diseases, esp. familial progression of vacular diseases, esp. familial progression of the disease that family in the target sefers refers to the constition of the cleavage state in full length CETP. The ribozymes then be position of the cleavage state in full length CETP. The ribozyme then consist to and/or expression of the mRNA. By inhibiting CETP, the reverse and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or aliminated) thereby preventing the reduction in size density of the high density consistenced transport (RCT) pathway can be inhibited (or aliminated) thereby preventing the reduction in size density of the high density in the analysis of CETP, specifically atherosclerosis, familial hyporthelesteroleans, peripheral vacular disease, dislibited managements, peripheral vacular disease, dislibited managements of the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The creases in LDL levels, and a corresponding increase in HDL levels of HDL included disposition and the CETP mRNA. As the HH ribozymes target specific regions of the CETP gene, they have low conspecific activity.

So sequence 15 BP; 4 A; 5 C; 2 G; 4 U;

Note-Tyctor: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from 3 pooled polylinker; 1st strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I oligo(dI) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          COMMENT
                                                                                                     /note="Organ: mixed (see below); Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI: Equal amounts of plasmid DNA from three normalized libraries (melanocyte 2NbHM, pregnant uterus NbHPU, and fetal heart NbHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223,
